Runs Java utilities (JVM-based applications, standalone JARs, etc.) and visually assess their performance and functioning. Profiles: CPU usage - it enables you to track usage of CPU resources, including CPU cycles and time spent on functions. Memory usage - it enables you to track memory allocations and active objects. Exceptions - it enables you to obtain snapshots of all exceptions that occurred in the profiling process. Monitor usage - it enables you to visually display CPU and memory usage. Deadlocks - it enables you to obtain detailed information about deadlocks that occurred during the profiling process.

Performance charts - it enables you to view information in a schematic manner.

Allocations - it enables you to display all allocations that occurred during the profiling process. Applications: Tired of running Java utilities to examine their performance, including CPU and memory usage? Do you wish to efficiently run Java utilities on a remote system without additional tools? Want to know how your Java-based app performs? Use YourKit Java Profiler to do the job and inspect the software with ease. How to Get Started with YourKit Java Profiler: Before getting YourKit Java Profiler, please download its trial version first, and then proceed with the setup process, after which you can open your Java-based utilities, and start

analyzing their performance. In order to profile a Java utility, you need to go through the ‘Tools’ section, from where you will obtain a new tab, and choose ‘Connect to Application’. YourKit Java Profiler will start investigating the app you selected in order to determine all its aspects. You can also configure YourKit Java Profiler by using ‘Integration Wizards’, allowing you to set up the tool for various technologies, including Eclipse, NetBeans, IntelliJ IDEA and Eclipse Vert.x. To obtain detailed information about YourKit Java Profiler, please check the readme.txt file, which will be uploaded with the tool. YourKit Java Profiler Specifications: User Interface: Visual mode, visual interface, with the help of

which you can launch and launch various Java applications and investigate their performance. Access: Publicly available via the Internet and easily accessible for everybody. Compatibility: Supported by Java 7, 8, and 9, and JDK 5.0, 6.0, 7.0, 8.0, and 9.0, along with the Sun J

KeyMacro is an advanced program macro keyboard tool for Windows that enables you to speed up your work and to improve productivity. What's more, you can also make your computer usable even when on a LAN or Internet-connected computer. KeyMacro is a software utility for Windows that includes a set of useful features such as searching for macros by

name, monitoring a list of current macros and playing back/recording new macros. KeyMacro can help you set your own keyboard shortcuts with KeyMacro and automate tasks in your software, giving you access to the product's large number of predefined hotkeys. Additionally, you can create your own unique commands by assigning a short text to a key, which can then be combined with other text commands and passed through to the Windows OS to perform a task. KeyMacro enables you to repeat a macro by pressing a key sequence, and to delete a macro by pressing another key sequence. In this manner, you can create new macros and assign them to a key sequence or key combination of the keyboard.

Using hotkeys you can run predefined or user-created macros, as well as monitor macros on the fly. KeyMacro can check if a macro is applied. KeyMacro can be 77a5ca646e

YourKit Profiler is a Java tool that helps developers in finding bugs, security loopholes and improving the performance of the application. License: freeware, shareware, trial, registration, trial, trial 3 reviews for YourKit Java Profiler Rated 5 out of 5 Eugene –June 7, 2015 Hi, I wanted to thank you for YourKit java profiler, it was my first time using java profiler. I've found YourKit Java Profiler to be a quite accurate, friendly and easy to use application, thanks for your hard work. Rated 5 out of 5 Benny Smit –June 5, 2015 YourKit Java Profiler, a very powerful Java profiler. You will like it. Lately, I was doing some performance optimizations for

my code, after that I decided to use YourKit Java Profiler as it was the most useful tool I've found so far. As we all know, Java developers need tools that they can easily use and I found YourKit Java Profiler to be exactly that. Installation process is very fast and it does not require Java SDK, you can use the tool with no problem. Once the application is launched, you can explore CPU profiling features and the overall experience is very simple. Besides this, the Java profiler presents a useful visualization for the call tree and memory usage data. The tool also provides some good summaries and options. I think YourKit Java Profiler is a very useful tool for developers and Java users. It's a must-have tool for any Java enthusiast. Best

YourKit Java Profiler is a software solution for profiling Java-based utilities from various points of view, including CPU and memory use. To make it work, we need to know how the size of memory is managed in C. The basic memory allocator makes it possible to allocate memory in chunks. The chunks are organized into a linked list: Each block has a pointer to the next block in the list, a pointer to the next chunk of free memory and a flag indicating whether it is empty or not. The allocator is the first part of the free list of chunks. The allocator has the right to use all chunks in the free list, if they are contiguous. YourKit Profiler is an integrated development environment for java development. It is an extension of

YourKit. A powerful profiling tool that allows developers to discover the problems of their code, speed up and optimize their programs. Highlights: Intuitive interface that provides full-screen views and all the necessary information without requiring any special knowledge. Automatically saved and loaded sessions that can be activated from any existing java tool (Debugger, IDE, Application) with a single click. Memory (and CPU) usage data and reports generation. A data collection/visualization extension that allows to select and extract information from a program's execution (stack traces, methods, exceptions, etc.), thus speeding up the analysis process. A data collection/visualization extension that

allows to select and extract information from a program's execution (stack traces, methods, exceptions, etc.), thus speeding up the analysis process. Integrated development environment that consists of the IDE and the Profiler (is a separate application), which enables the creation of programs without having to use the profiler. It provides the user with an extensive set of features and tools for the analysis and the optimization of software, both in memory and CPU usage. The development of the integrated environment was based on the YourKit profiler, a powerful Java profiler that provides a very complete data collection and reports generation. Interface that has been adapted to the special needs of Java developers: •

Auto saved sessions - it allows to restore the same session in different Java applications. • Profiling sessions - every session can be used as a library to save time and memory, by loading the library from a previous execution. • Full-screen - the profiler can be configured with all the necessary buttons in a single place on the screen. Profiling your application from the standpoint of CPU and memory usage is quite important, as it enables you to optimize its performance and limit its impact on the host system resources, which is always appreciated by end-users. With the help of YourKit Java Profiler, you can easily run your Java-based program and assess its functioning, analyzing and measuring several aspects of its runtime,

enabling you to determine what could be improved. Well-
