Q: Microsoft.Office.Interop.Word.Document doesn't have a property named 'Range' I am trying to modify a word document through VBA so that a defined area changes its font color, but I keep getting this exception. I already tried setting the object to the following: document.Range(Range.Text) but I get the same exception. Microsoft.Office.Interop.Word.Document doesn't have a property named 'Range' This is my code Dim doc As Word.Document Dim wrd As Word.Application Dim doc\_range As Word.Range Dim sub\_range As Word.Range Dim rang As Range Set wrd = CreateObject("Word.Application") wrd.Visible = True Set doc = wrd.Documents.Open(App.Path & "" & doc\_name & ".docx") Set doc\_range = doc.Content doc\_range.Text = "Some Text" doc\_range.Font.Color = Word.WdColorIndex.wdColorBlack A: You have a minor issue in the set up for doc\_range.Text. The line: Set doc\_range = doc.Content should be: Set doc\_range = doc.Content.Find("Some Text") This allows you to use doc\_range to access the text you want to modify. Setting doc\_range.Font.Color doesn't have a method for setting a color. You need to use doc\_range.Font.Color = Word.WdColorIndex.wdColorBlack. up, right, the father of the groom and mother of the bride, who has just shared the best man's toast to the couple toasting them with him, makes his way through the crowd of guests, the groom at his side, to make his way to the bride and groom. What a great moment. And here's the bride and groom toasting each other, over and over again. To a great wedding. OK, the second shower is over, the wedding
